## Package 'fauxnaif'

September 4, 2020

```
Title Convert Values to NA
Version 0.6.1
Description Provides a replacement for dplyr::na_if(). Allows
     you to specify multiple values to be replaced with NA using a single
     function.

na\_if\_in

## **R** topics documented:

faux_census				•	•				•	•			•				•	•	•		4
na_if_in																					1
scoped_na_if .																					4

Index 6

faux\_census

A small sample of a fabricated census-like dataset

## Description

A dataset containing fake demographic data, used in the fauxnaif vignette.

## Usage

faux\_census

#### **Format**

A tibble with 20 rows and 6 variables.

### Source

Fabricated

na\_if\_in

Convert values to NA

## Description

This is a replacement for dplyr::na\_if(). It is useful if you want to convert annoying values to NA. Unlike dplyr::na\_if(), this function allows you to specify multiple values to be replaced with NA at the same time.

- na\_if\_in() replaces values that match its arguments with NA.
- na\_if\_not() replaces values that do not match its arguments with NA.

## Usage

```
na_if_in(x, ...)
na_if(x, ...)
na_if_not(x, ...)
```

na\_if\_in 3

### **Arguments**

x Vector to modify

... Values to replace with NA, specified as either:

- An object, vector of objects, or list of objects
- A one-sided formula (see section "Formulas")

#### Value

A modified version of x with selected values replaced with NA.

#### **Formulas**

These functions accept one-sided formulas that can evaluate to logical vectors. The input is represented in these conditional statements as ".". Valid formulas take the form  $\sim$  . < 0. See examples.

#### Lifecycle

**Deprecated** na\_if() has been deprecated in favor of na\_if\_in() to avoid masking dplyr::na\_if().

#### See Also

```
dplyr::na_if() to replace a single value with NA.
dplyr::coalesce() to replace missing values with a specified value.
tidyr::replace_na() to replace NA with a value.
dplyr::recode() and dplyr::case_when() to more generally replace values.
```

## **Examples**

```
-1:10
# We can replace -1...
# ... explicitly
na_if_in(-1:10, -1)
\# \ldots by specifying values to keep
na_if_not(-1:10, 0:10)
# ... using a formula
na_if_in(-1:10, ~. < 0)
\# \ \dots \ \text{or using a function}
na_if_in(-1:10, min)
messy_string <- c("abc", "", "def", "NA", "ghi", 42, "jkl", "NULL", "mno")</pre>
# We can replace unwanted values...
\# ... one at a time
na_if_in(messy_string, "")
\# ... or all at once
na_if_in(messy_string, "", "NA", "NULL", 1:100)
na_if_in(messy_string, c("", "NA", "NULL", 1:100))
na_if_in(messy_string, list("", "NA", "NULL", 1:100))
# ... or using a clever formula
grepl("[a-z]{3,}", messy_string)
na_if_not(messy_string, ~ grepl("[a-z]{3,}", .))
# na_if_in() is particularly useful inside dplyr::mutate
library(dplyr)
```

4 scoped\_na\_if

```
faux_census %>%
  mutate(
    state = na_if_in(state, "Canada"),
    age = na_if_in(age, ~ . < 18, ~ . > 120)
# We get a message if our values to replace don't exist
na_if_in(-1:10, 11)
# And a warning if we use an invalid input...
# ... like a two-sided formula
na_if_in(-1:10, x \sim . < 0)
# ... NULL
na_if_in(-1:10, NULL)
# ... or nothing at all
na_if_in(-1:10)
# This function handles vector values differently than dplyr,
# and returns a different result with vector replacement values:
na_if_in(1:5, 5:1)
dplyr::na_if(1:5, 5:1)
```

scoped\_na\_if

Convert values to NA in multiple columns

## **Description**

## **Deprecated**

## Usage

```
na_if_all(.tbl, ...)
na_if_not_all(.tbl, ...)
na_if_at(.tbl, .vars, ...)
na_if_not_at(.tbl, .vars, ...)
na_if_if(.tbl, .predicate, ...)
na_if_not_if(.tbl, .predicate, ...)
```

## **Arguments**

.tbl A tbl object

... Values to replace with NA, specified as either:

- An object, vector of objects, or list of objects
- A one-sided formula (see section "Formulas" in na\_if())

.vars A list of columns generated by dplyr::vars(), a character vector of column names, a numeric vector of column positions, or NULL.

scoped\_na\_if 5

.predicate

A predicate function to be applied to the columns or a logical vector. The variables for which .predicate is or returns TRUE are selected. This argument is passed to rlang::as\_function() and thus supports quosure-style lambda functions and strings representing function names.

#### **Details**

The dplyr::scoped variants of na\_if() and na\_if\_not() can be used directly within pipelines and can modify multiple variables at once.

- \*\_all() affects every variable
- \*\_at() affects variables selected with a character vector or dplyr::vars()
- \*\_if() affects variables selected with a predicate function

#### Value

A modified data frame. Matched values in selected columns are replaced with NA.

#### See Also

```
na_if_in() and na_if_not() operate directly on vectors
dplyr::mutate_all(), dplyr::mutate_at() and dplyr::mutate_if() can apply any function
to variables selected in the same way
```

## **Examples**

```
## Not run:
df <- data.frame(a = 0:5, b = 5:0, c = as.numeric(0:5), d = letters[1:6])
na_if_all(df, 0)
na_if_not_all(df, 0:3, "c")

na_if_at(df, c("a", "c"), 0)
na_if_not_at(df, c("a", "c"), 0:3)

na_if_if(df, is.integer, 0)
na_if_not_if(df, is.integer, 0:3)

## End(Not run)</pre>
```
